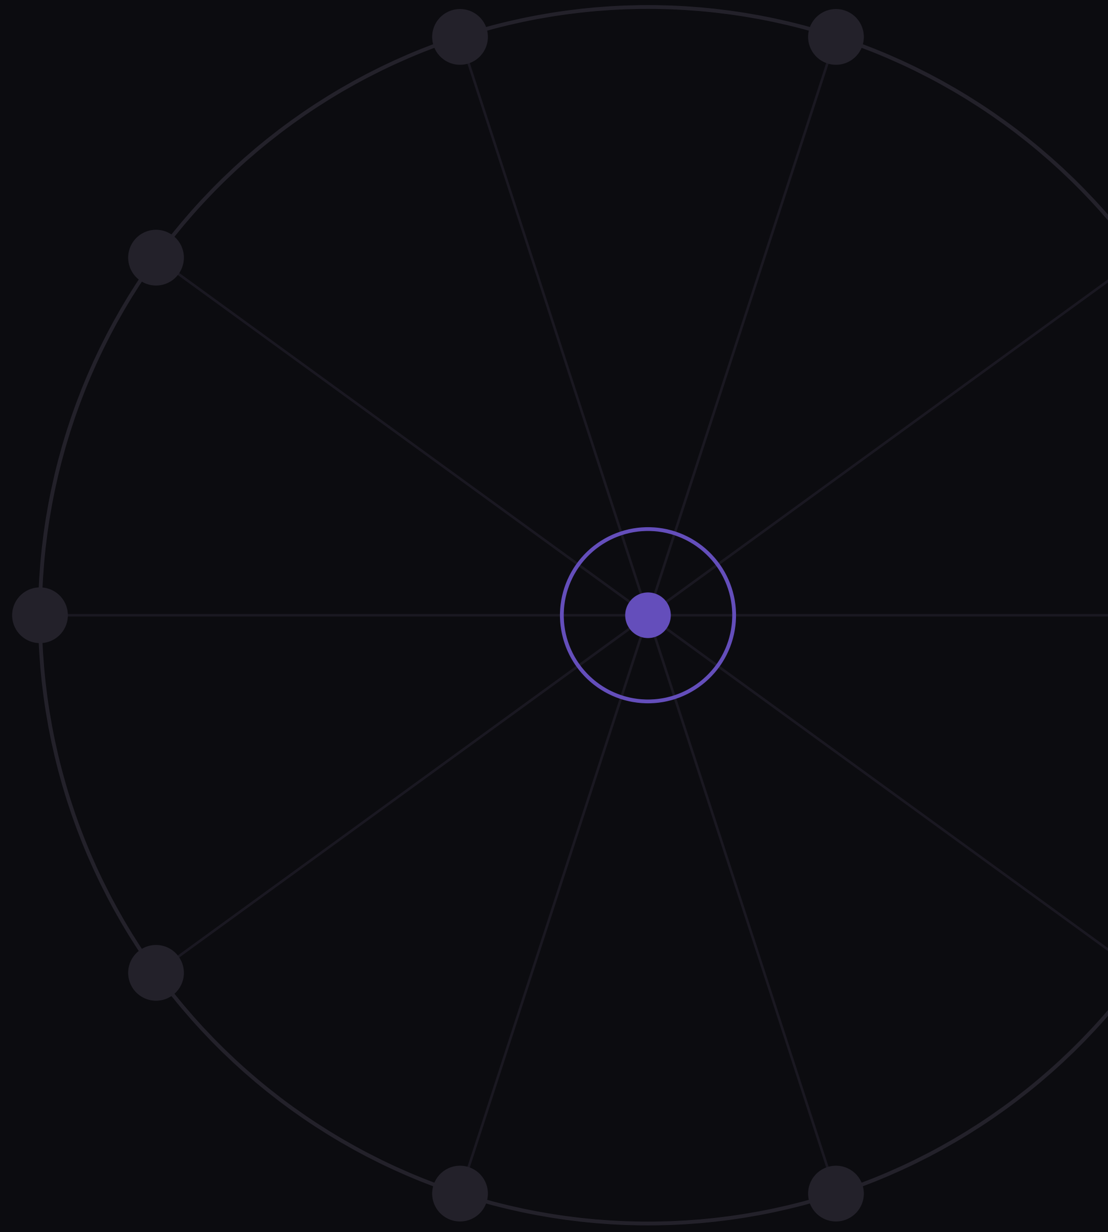
COMMUNITY CAPITAL MARKETS

OBJEX

Transforming the world's oldest financial system into programmable trading capital.

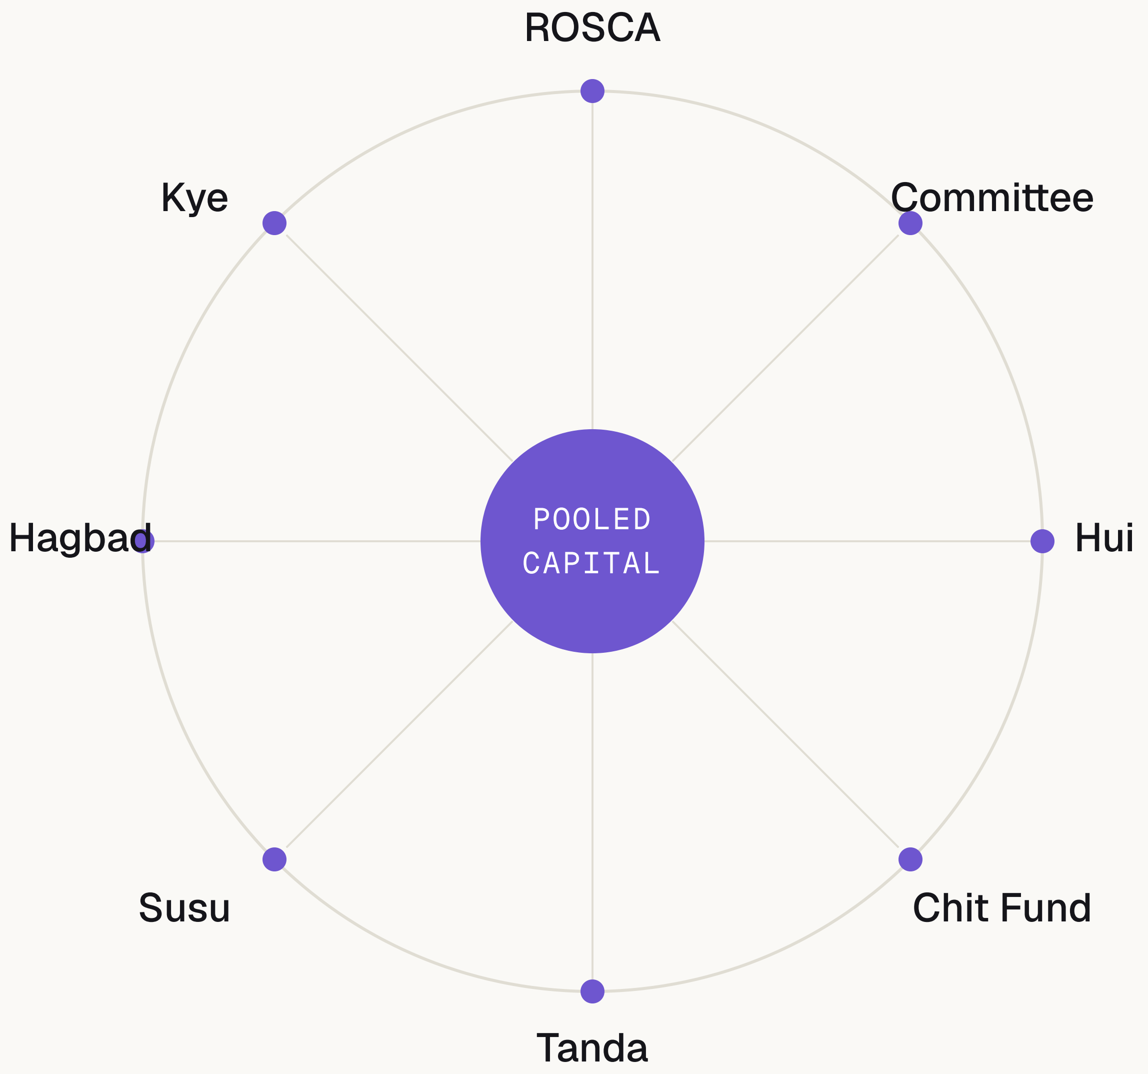


Before banks, there were circles.

For thousands of years, communities have coordinated capital by pooling money and rotating access. The same behavior appears, independently, in nearly every culture on earth.

100s of millions
PARTICIPANTS TODAY

1,000s of yrs
CONTINUOUSLY IN USE



It works. It just never scaled.

The flaw is structural. The moment capital leaves the pool, the system depends on human trust — and trust does not scale past the people you know.

CAPITAL LEAVES THE POOL

A member takes their turn.

→

FAILURE 01

Trust becomes enforcement

FAILURE 02

Collection becomes manual

FAILURE 03

Defaults become inevitable

→

OUTCOME

Scale becomes impossible.

THE CORE INSIGHT

Everyone is tokenizing assets. We tokenize behavior.

EVERY OTHER PROTOCOL

~~Digitize the asset~~

Wrap a dollar, a treasury, a deed. The thing already exists — you just move it on-chain.

OBJEX

Digitize the coordination

Encode how people pool, commit, and create capital together. The behavior becomes programmable infrastructure.

A new layer of the financial stack.

Exchanges	Match buyers and sellers	`create markets`
Banks	Underwrite and extend deposits	`create credit`
Lenders	Collateralize and loan against assets	`create borrowing power`
OBJEX	Communities pool and commit together	`create buying power`

Communities create buying power together.

01
Contribute
Members deposit capital into a shared pool.

→

02
Pool
Contributions aggregate into collective capital.

→

03
Access
Participants draw real buying power to trade.

→

04
Secure
The protocol locks future obligations; profit stays withdrawable.

Community participation becomes **programmable capital infrastructure** — capital never has to leave the pool to be used.

THE OBLIGATION ENGINE

Obligations become programmable collateral.

CURRENT EQUITY

What you hold

Your stake plus realized gains, live.

−

REMAINING OBLIGATION

What you owe the pool

Future commitments still outstanding.

=

WITHDRAWABLE BALANCE

What you can take

Only what no commitment depends on.

Recomputed continuously, the protocol can never release capital a future obligation still needs. Trust is replaced by math.

$20,000 becomes $200,000 in buying power.

10 PARTICIPANTS × $20,000

One participant draws the pool's buying power.

COMMUNITY POOL

$200,000

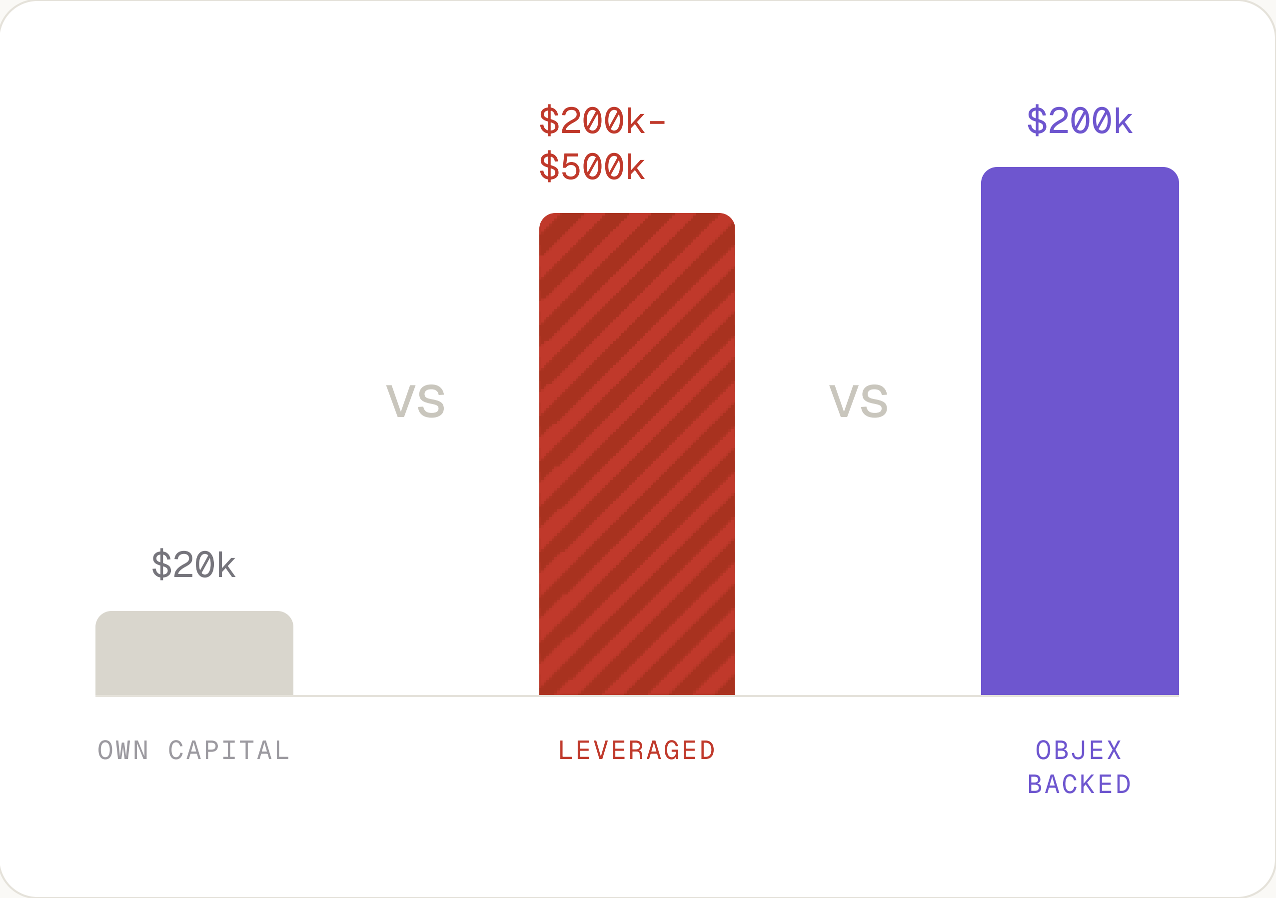
Buying power, fully backed.

Profits	withdrawable
Obligation	secured
Pool	intact

They don't lack discipline. They lack capital.

A trader with $20,000 reaches for 10–25× leverage to control positions they could never fund. Leverage is a symptom of undercapitalization.

- Liquidation risk on every wick
- Risk management becomes impossible
- Participation horizons collapse to days



WHAT IT IS NOT

- ~~A savings app~~
- ~~A lending protocol~~
- ~~A perpetual DEX~~
- ~~A neobank~~
- ~~A social trading app~~

IT IS A NEW CATEGORY

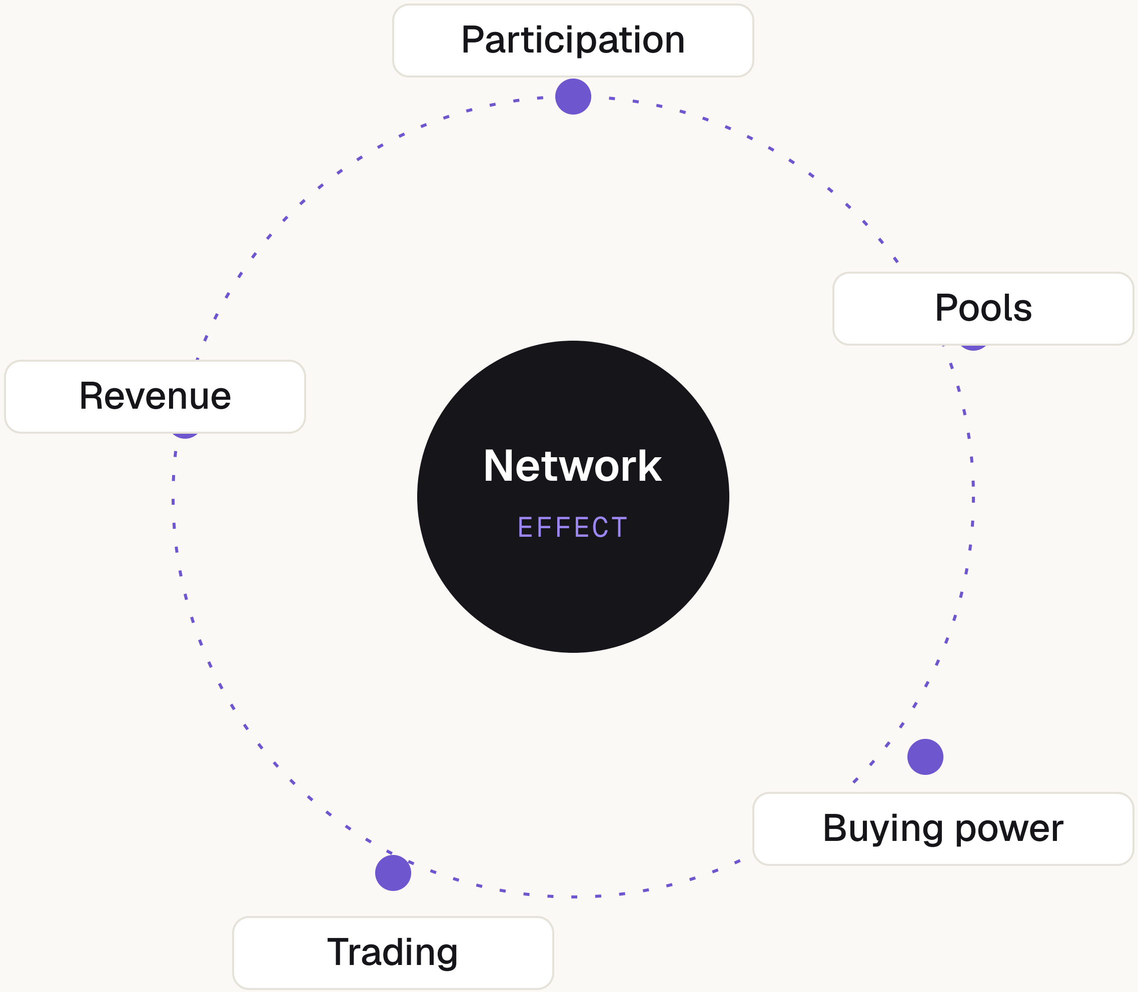
Community Capital Markets

The first place where a community's coordination becomes a tradeable source of capital.

A network that compounds.

Each participant makes the next pool deeper. Each pool makes the next participant's buying power larger.

More capital → more buying power → more participants



Seven points of monetization. One pool.

Revenue compounds with buying power deployed — not with the number of users.

01
Pool creation
Fee to spin up a community pool.

02
Allocation
Fee on buying power drawn.

03
Trading
Spread on executed volume.

04
Risk management
Fee on obligation protection.

05
Premium pools
Higher-tier pool products.

06
Analytics
Data and performance tooling.

07
Institutional
Infrastructure for funds & desks.

Take-rate on every dollar of buying power created.

Between two of the largest markets on earth.

COMMUNITY FINANCE

active participants worldwide

OBJEX

Community Capital Markets

PERPETUAL MARKETS

$Trillions

traded annually, PMF proven

Three curves just crossed.

Each trend existed alone for years. The opportunity is the moment they intersect.

01

Perp markets hit PMF

Perpetuals are now the most active venue in crypto, with proven, durable demand.

02

Infrastructure matured

Settlement is finally fast, cheap, and programmable enough to hold obligations on-chain.

03

Community finance offline

Hundreds of millions still coordinate capital manually. The behavior is proven; the rails are missing.

THE LONG TERM

The next financial system won't digitize money. It will digitize coordination.

OBJEX becomes the infrastructure layer for community-generated capital — turning collective trust into programmable buying power, anywhere on earth.
